

ABSTRACT

[0022] A water sink toy is sized and dimensioned to move and sink in water so as to simulate a squid, or the like. The sink toy includes a shaped, weighted head having an opening formed therein. A number of tentacle-like, floatable elongated members are secured to the head so as to move in water and provide buoyancy to the sink toy. The opening in the head may be used to grasp the head, to enable it to be worn on a finger in the manner of a ring, or to be attached to other objects.
